Belt Drive Direction

Belt/Oil Contact Point
(Actual Oil Grab Point!)

Oil/Water Interface Layer

Belt Drags Water Into Oil Interface Layer. Prevents Oil From Coating Belt.

Belt Drags Oil Down Into Water.

Water Flow

Water Flow Pulls Oil Off Belt.

Free-floating oil and grease is reintroduced to water or coolant by Belt Skimmer. Water flow pulls oil off Belt and into metal working machines, rolling mills, filters and pumps. Oil reintroduced to water or coolant increases oil concentration levels which can increase oil & grease discharge levels, bacterial growth, water treatment costs and reduce product quality.
